The flowers vary from the most delicate shades of pink to brilliant crimson and maroon, from pale lavender to richest blue, while many other uncommon shades are well represented. Some are striped, mottled and rayed in a most pleasing manner, many of the flowers being also of singular and unusual shape. 6*d*. and 1*s*. per packet.

ERIGERON AURANTIACUS HYBRIDUS.

## 12. ERIGERON AURANTIACUS HYBRIDUS.

A hybrid variety of tho well-known and attractive "Orange Daisy," differing from tho type in its greater floriferousness and range of colour. While the type seldom bears more than one, or at most two, orange-coloured flowers on a stem, the new hybrid's many branched stems bear a number of flowers in varying shades of colour from white to rose, and from yellow to deep orange. 1*s.* per packet.

MIGNONETTE, "GOLDEN JEWEL."

## 13. KALANCHOE FLAMMEA.

This is by far the finest of the Kalanchoes in cultivation, and although coming from a tropical region, will thrive and flower freely in the temperature of a comparatively cool Greenhouse, when fully exposed to the light.

The whole plant averages 15 to 18 inches in height; its stout erect stem is furnished at the base with pale green obovate leaves 2½ to 3½ inches long and 1½ to 2½ inches wide, above which the brilliant inflorescence stands prominently exposed. The individual flowers are about half an inch in diameter, and as the cut bloom will last fresh in water for at least a fortnight, it will be found exceedingly useful for room and table decoration. 2*s.* 6*d.* per packet.

PANSY, "MASTERPIECE."

## 14. MIGNONETTE, "GOLDEN JEWEL."

A very high coloured variety of the "grandiflora" type, bearing charming heads of crimson-red flowers. A most desirable new colour in these perpetual flowering Primulas.

## 17. PRIMULA STELLATA.

The flowers of this most distinct variety are most elegant, and extremely useful for cutting and other decorative purposes. The attractive dark red foliage makes a most effective contrast to the innumerable white star-shaped flowers, which form large and most graceful pyramids. It requires the same treatment as the ordinary *Primula sinensis*, and consequently can be grown with it. 2*s*. 6*d*. per packet.

SALPIGLOSSIS VARIABILIS SUPERBISSIMA.

## 18. STREPTOCARPUS, "SNOW QUEEN."

## 19. SALPIGLOSSIS VARIABILIS SUPERBISSIMA.

**(NEW "EMPEROR" SALPIGLOSSIS.)**

This Novelty is entirely different from any other Salpiglossis by reason of its peculiar habit, producing only *one thick main stem*, which is thickly covered with blossoms, presenting, as it were, a compact bouquet of flowers.

The individual blooms are richly veined with gold, and are considerably larger than those of the old "grandiflora" type. 1*s*. per packet.

# COLLECTIONS & ASSORTMENTS OF EXTRA CHOICE FLOWER SEEDS.

*Sow Aster seed in April and May, in pans, or on a spent hot-bed in drills 6 inches asunder; when the plants are 1 inch high, prick out into a cold frame, or under hand-glasses, 3 or 4 inches apart, from whence they can be planted out when 4 inches high. Select showery weather for planting out, when the ground is in good working order; plant in rows 1 foot apart each way. To grow Asters to perfection, a rich soil is indispensable, and during dry weather they should be watered, and a top-dressing of well-rotted manure applied early in August.*

## TIME OF SOWING.

**HARDY ANNUALS** may be sown in March and April (and for early spring blooming in August and September), in a sheltered situation, and when up, thinned so as to keep them strong. In March they may be transplanted where they are to bloom. Before sowing, which should be done on a fine dry day, carefully prepare the soil, and in covering, regulate the thickness by the size of the seeds—small seeds should be very lightly covered. Success in growing annuals depends in a great measure upon their being properly thinned to regular distances, so as to give plenty of room for the full development of each plant; this, in too many instances, is entirely neglected, hence the dissatisfaction so often expressed as to their use.

**HALF-HARDY ANNUALS** may be sown in March and April, in pans, placed on a slight hot-bed, and, when strong enough, pricked out into a cool frame near the glass, where they may get hardened and well established for transplanting into their blooming quarters early in May, or potted off singly for conservatory and greenhouse decorations. Under favourable circumstances many varieties will bloom freely if sown in the open ground about the middle of May.

**TENDER ANNUALS** such as Balsams, Celosias, Thunbergias, &c., require raising in a temperature ranging from 60° to 70°. Sow in pans or pots, and place near the glass; keep the soil moist, and shade from the sun until the plants appear. When strong enough, pot off into small pots, keeping them near the glass, and admitting air on every favourable occasion.

**BIENNIALS AND PERENNIALS.**—The more select and tender varieties for summer and autumn blooming may be sown in a gentle heat in March and April, and pricked out into pots until fully established, and then potted off singly, or transplanted into the open ground, as required. The hardier varieties may be sown in the open ground, in prepared beds, in June and July, and when strong enough transplanted into nursery beds, or where they are intended to bloom the following year.

# GLADIOLUS.

## (HYBRIDS OF GANDAVENSIS.)

There are few flowers more showy and beautiful than the Gladiolus, and the varieties of the *Gandavensis* section are perfectly hardy and easily grown, whilst their erect and stately growth, and long spikes of flowers, developing themselves successively, never fail to win admirers.

To facilitate the cultivation of this highly decorative plant, a few remarks may be necessary to some :—

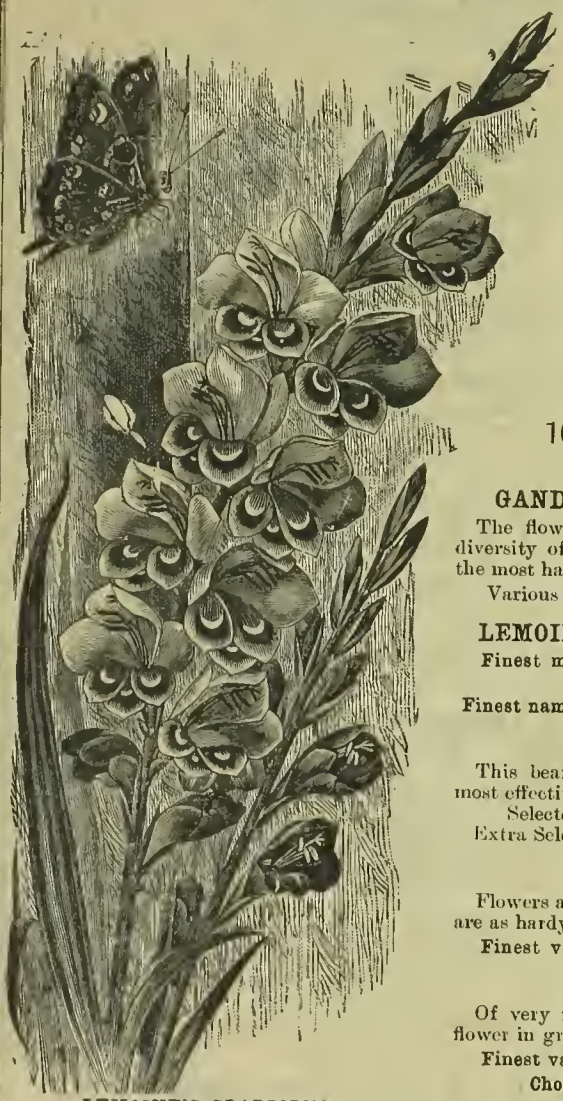
The best and safest time for planting is from the beginning of April to the end of May, when a continuous bloom may be assured from July to September.

Soil is not much a point for consideration, so long as it is not stiff and consolidated ; but it is important that it should be deeply dug previous to planting.

Large bulbs should be planted from 3 to 4 inches, and smaller bulbs 2 inches deep.

During excessively dry weather, copious waterings are recommended.

When any bulbs show signs of growth before the time mentioned above, they should be potted and kept in a cool frame until the proper season for planting out.



LEMOINE'S GLADIOLUS.

This beautiful tribe of plants should be largely planted everywhere.

Orders are booked throughout the year at the following prices, and the bulbs supplied in January, February, or March.

# DOUBLE TUBEROSES.

(POLIANTHES TUBEROSA.)

The chaste double flowers of *Polianthes* are well known for their delicious fragrance and pearly whiteness, being admirably adapted for Button-holes, Bouquets, &c.; indeed, are of the greatest value wherever cut flowers are required. By successional plantings these lovely flowers may be had all through the summer and autumn. They should be potted in rich loamy soil and started in a good bottom heat, being afterwards grown on in a stove, with plenty of moisture. If not required in flower until September, the bulbs may be potted in March or April, and placed in a cold frame, standing them in the open during the summer. As soon as the flower spikes are about a foot high, the plants should be transferred to a greenhouse or even a room, when their chaste and fragrant flowers will be developed in a most satisfactory manner.

The colours are most varied, every hue being pure and distinct, while some of the kinds are spotted and maculated in a most pleasing manner.

# BULL'S FOOD FOR PLANTS.

Contains in a concentrated form all the essential elements of plant life. It is of immense benefit applied as a top-dressing to plants and bulbs of all sorts grown in pots, especially when pot-bound, completely restoring exhausted energy, a few applications ensuring vigorous healthy growth, the flowers being produced in a most luxurious manner, combined with great richness of colouring. It can also be mixed with ordinary soil in potting, or may be used with most beneficial effect for Chrysanthemums, Shrubs, Vines, and all kinds of Fruits, whether in pots or planted in the open air.

**ANALYSTS' REPORT.**

The analysis shows this to be a complete Plant Food, and of the highest quality. The material not only contains an abundance of all the constituents necessary for plant growth, but the analysis shows also that the four chief constituents are each in that combination which renders them in the most beneficial and available form for the healthy development of plants.

For these reasons, users of this Plant Food in the proper quantities cannot fail to produce the very best results within the capability of their plants.

## DIRECTIONS FOR USE.

**For POT PLANTS AND BULBS.**—Sprinkle on the surface of the soil, about every three weeks, at the rate of a small teaspoonful to a 5-inch pot, so that when the plants are watered, the Plant Food will be gradually absorbed into the soil.

**For CHRYSANTHEMUMS.**—At the time of potting, some of the Plant Food should be thoroughly mixed with the compost, and afterwards, when the buds begin to swell, frequent top-dressings should be given, the quantity used being estimated according to the size of the pots and vigour of the plants.

**For ROSES, SHRUBS, VINES, &c., in Pots.**—Use about a tablespoonful to a 12-inch pot several times during the season.

**For PLANTS, FRUITS, ROSES, and all Plants in Borders and the Open Ground.**—Apply about 2 ozs. to the square yard as often as occasion may require, raking and watering it in.

**For LAWNS.**—Scatter broadcast at the rate of 2 ozs. to the square yard, and well water.

Sold in Tins, containing about 1½ lbs., price 1s. each. Larger Size, containing about 5 lbs., 2s. 6d. each.
